Estimating chances from the past

A book from London, 1662

Claude de Jongh, *View of London Bridge*, 1632, detail. Yale Center for British Art. Wikimedia Commons, public domain

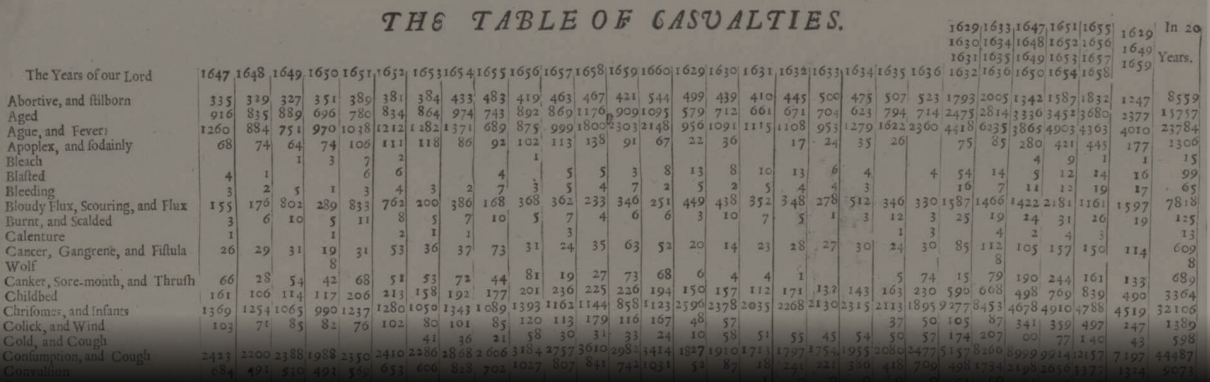

The Bills of Mortality

London, seventeenth century

Every week, the parish clerks of London print the burials of the week and what each person died of. Londoners read these bills in fear of the plague and of many other diseases.

How afraid should a Londoner be of each disease?

Parish Clerks of London, bill of 5 to 12 September 1665, detail.

Hanged themselves	222
Kil'd by several accidents	1021
Murthered	0086
Poysoned	014
Smothered	026
Shot	007
Starved	051
Vomiting	136

13. In the foregoing Observations we ventured

John Graunt, *Observations*, 1662, page 17, detail. US National Library of Medicine. Internet Archive, public domain

"Whereas many persons live in great fear, and apprehension of some of the more formidable, and notorious diseases... I shall onely set down how many died of each: that the respective numbers, being compared with the Total 229250, those persons may the better understand the hazard they are in."

Graunt divides each count by all the deaths.
From the past, every Londoner can estimate the hazard of each disease.

John Graunt, *Natural and Political Observations... upon the Bills of Mortality*, London, 1662, chapter 2

Weekend 2

The estimate

We estimate the chance of an event
from how often it happened before.

For a product shown to a customer, the estimate of a tap is the number of taps divided by the number of showings.

The more showings, the closer the estimate
tends to get to the true chance.

Claude de Jongh, *View of London Bridge*, 1632, detail. Yale Center for British Art. Wikimedia Commons, public domain

Weekend 2

Estimating chances today

Each option gets an estimate of its chance from the past,
and the most promising is shown.

Spotify	mixes of music and podcasts for the home page
Amazon Payments	images and taglines for a page
Online shops	products for a customer
News sites	headlines for a story

Such estimates decide much of what we are shown online.
